

AuthentiCare Mobile Work Flow for visit with no data connection

Shows how to order a Q/R card when checking in.

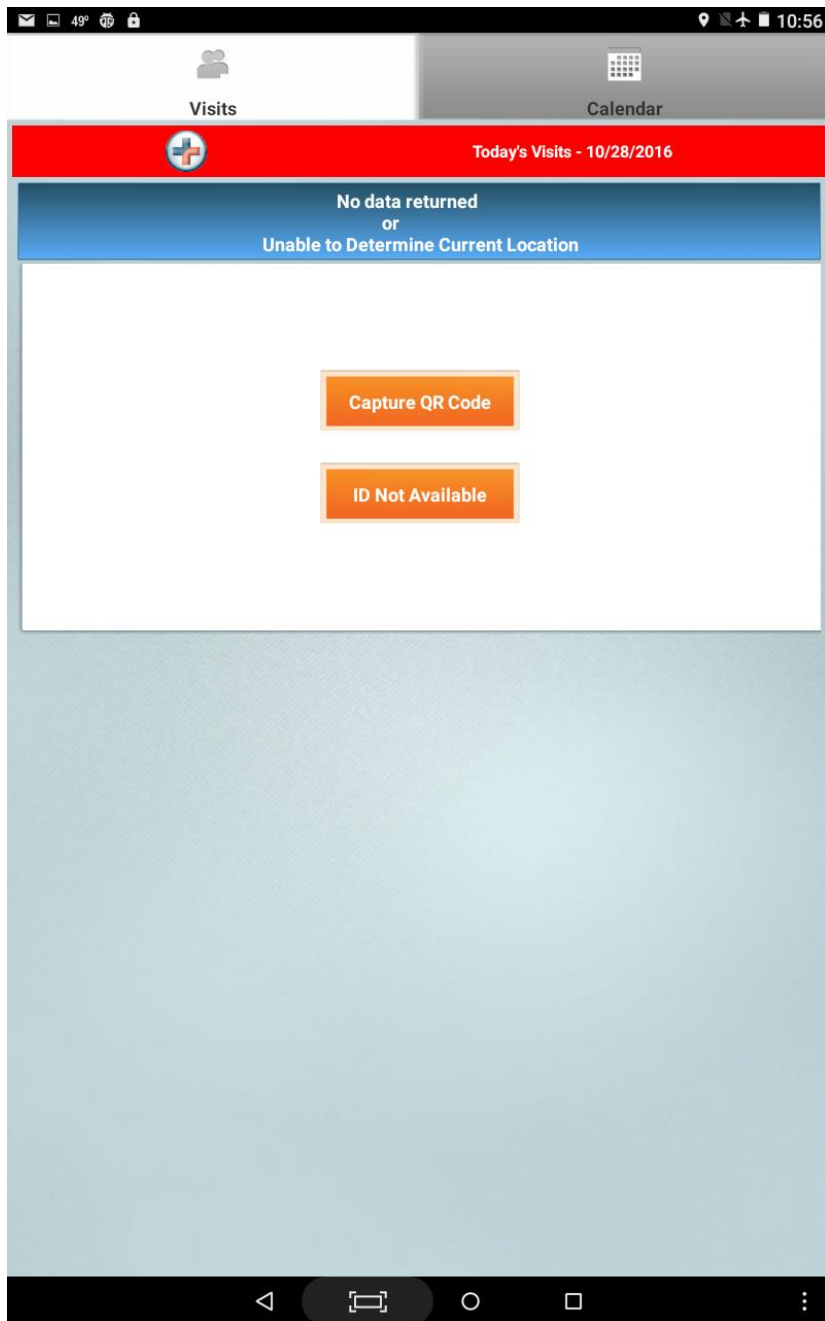

User does initial login for the day in a location with data connection and sees the following:

User goes to the home where there is no data connection and logs in again when the user gets there. The following page displays with the red banner:

The red banner means there is no data connection to the phone. The user taps the manual check in button and goes to the page below:

Since the client does not have a Q/R card, the worker clicks on the “ID not available” button, and goes to the page below. The worker enters the CLTC number of the client and the service the worker plans to perform. To request a Q/R card, the worker simply checks the box below the service selection. That is ALL there is to ordering a Q/R card – just check the box and hit submit check in.

The screenshot shows a mobile application interface for checking in. At the top, there are icons for 'Visits' and 'Calendar'. Below them is a red banner with a medical cross icon and the text 'Today's Visits - 10/28/2016'. The main section is titled 'Check-In' and contains the following fields:

- CLTC Number:** A text input field containing '1113011'.
- Service:** A dropdown menu showing '1 service selected' and 'Personal Care 1'.
- Request ID Card:** A checkbox that is checked, indicated by a green checkmark icon.

At the bottom of the form area is an orange button labeled 'Submit Check-In'. Below the form is a numeric keypad with the following layout:

-	+	.	1	2	3	✕
*	/	,	4	5	6	Done
(	)	=	7	8	9	
			*	0	#	

The bottom of the screen shows standard Android navigation icons: a triangle, a rectangle, a circle, a square, and a list of three dots.

Since there is no data connection, the check in AND the Q/R card order are queued on the page below. Note that the client name is NOT displayed because the app does not have a data connection to look it up and determine if the worker is allowed to see it. So the worker sees the CLTC number the worker typed in. When the worker finishes the visit, the worker hits the check out button.

Check-In Queued	
1113011	
Service:	Personal Care 1
Actual Check-In:	Scheduled Check-Out:
10:58 AM	
Latitude:	Longitude:
39.274363	-84.38024921

Check-Out

The worker is taken to a page where the worker can select activities and observations and submit their checkout.

Visits Calendar

Today's Visits - 10/28/2016

Check-Out

1113011

Service: Personal Care 1

Activity Code: Select Activity Code

Dressing or Undressing
Toileting
Ambulation and Mobility
Meal Preparation and Set-up

Observation Code: Select Observation Code

No observations to report

Actual Check-In: 10:58 AM

Scheduled Check-Out:

Submit Check-Out

Then the checkout is queued on the phone:

49° 10:59

At any time, including after checking in or after checking out, the user can touch the AuthentiCare button (the one with the cross) and return to the visits page. Note in this example, the user still does not have a data connection so the check in, check out, and Q/R card order are all still queued.

When the user returns to an area with a data connection, the visits still show as queued until they transmit to the Care Call system. But since the user has a data connection, the banner is white. In Android this page does not automatically refresh the status. One way to refresh is for users to touch the manual check in button and then immediately touch the AuthentiCare button at the upper left to cancel out and return to this page.

When the visits have been sent to Care Call, they will be in completed status as shown below. Note that to limit data usage, the checkout push process waits two minutes to retry if the initial push fails. So the user may have to wait a few minutes and refresh the screen a few times if the data connection is weak.
